

BITCOINMONO

Lauch date 10th Feb 2019

"Mono" in Esperanto means "cash" so first and foremost BitcoinMono is a digital cash. By integrating useful features from other coins, it adapts better to changing environment and distinguishes itself from all other coins by its own model, copy-paste. Current focus is on eSports industry.

I. True anonymity

BitcoinMono is a cryptocurrency based on CryptoNote technology. Our goal is to give users complete anonymity while having fast transactions. It's not a fork of another blockchain, and it has a long and relatively flat emission curve. With its own genesis block there is no degradation of privacy due to Borromean Ring Signatures using different participants for the same tx outputs on opposing forks. BitcoinMono uses mixin so everyone is on the same playing field, making transactions difficult to trace.

II. Gaming focus

The BitcoinMono developers are currently working on mobile as well as desktop game and entertainment area to reward users in BitcoinMono. It creates a new form of incentivization that can be used outside of the games for online products or payments to friends and family. This will introduce individuals to cryptocurrency and grow the space. We plan to make an entire ecosystem of different entertainment genres, from casual games, to games of luck to involve more users in the BitcoinMono community.

III. Secure and private

CryptoNote technology is the foundation of BitcoinMono. CryptoNote technology uses ring signatures to mix transactions within the daemon. It forms a solid and well tested basis allowing us to keep our coin profitable to every single miner by having a slowly declining block reward and an ASIC resistant algorithm.

IV. Specifications

1,000,000,000,000 Total supply
50 second block time
Cryptonight-pico algorithm
Zero Dust threshold
Completely private transactions with ring signatures

V. Team

BitcoinMono is developed and supported by semiPOOL pool.
